

Forklift Fork Positioners

Forklift Fork Positioner - The fork positioner is a hydraulic device that could allow the individual driving to be able to control the lift truck without leaving the seat. They are made out of high quality materials and are designed to withstand the most demanding procedures and work environments. Side shifting units have the added ability to laterally position the entire load or the arms in order to facilitate more precise carrying and position in a faster and much more efficient way.

The unique blade pocket design enables operators to safely swing the unit's forks without any worry of destroying the positioning cylinders. This can allow the worker the option to either execute simultaneous or independent blade movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are needed. Standard OEM carriages could be transformed into fork positioners on existing units.
